APPENDIX A: DATA ANALYSIS

1. Weighting

Differential sampling rates were applied to the population according to strata, clusters, and substrata (AID, students from Taiwan and Iran, and the rest). Therefore, observations needed to be weighted in order for them to properly represent the population. Through consultation with a survey sampling specialist at the Department of Statistics, Iowa State University (Fuller, 1979) weights were computed. Readers may wish to contact the authors for details.

2. Statistical Analyses.

We employed the service of a computer scientist for an algorithm of SUPER CARP (et al., 1979) to be transferred into the SAS system. This operation was necessary in order to obtain inbiased estimators of variances and standard errors of means. Population means were also estimated with the same technique. SUPER CARP was invented by Prof. Fuller and his associates at the Department of Statistics, Iowa State University. It can compute variances for a sample with strata and clusters such as ours, while other known programs such as SAS and SPSS are not able to do so.

For the details of sampling, see the section of sampling procedure in the Phase II final report.

To test hypotheses where independent variables were categorical measures, tests for unequal sizes and variances were used to compare weighted means between categories of students (Pp. 116-117, Ott, 1977). To determine significance of the test results, we used .01 level rather than .05 level (Warren, 1980), since our extremely large sample size tends to produce statistically significant results even when the results may not have substantive significance. Taking a higher level of statistical significance, we attempted to fill the gap between these two types of significance, especially when our interest is to determine whether or not substantive differences existed among students in terms of needs.

Where independent variables were not categorical or nominal, we used correlation coefficients to identify associations between dependent variables (need composites) and independent variables. Use of correlation coefficients should be regarded as a preliminary unalysis. We hope to apply other statistical techniques to analyze the relationships of these variables in Phase III, if granted. Due to our large sample size, even a small coefficient was statistically significant such as r of only .05. However, such a small coefficient means substantively not much of a correlation between the two variables. Therefore, as far as correlation coefficients are concerned, we will report the results from a substantive point of veiw. Even though most of the coefficients were statistically significant, we will report only those where one variable accounted for 5% of variance in the other (the low category) and 10% or higher (the high category). We consider this approach to be much more meaningful than reporting statistical significance of popular levels, when the size of the sample is extremely large (warren, 1980).

In the following section, the results of data analyses will be presented. First, the results of univariate analyses will be given. Second, the results of hypothesis testing will be reported. Third, bivariate analyses of other variables besides need composites will be presented.

3. Univariate Analyses

The following are univariate tables. All the tables present population estimates which were computed with use of weights. Frequencies with weighted observations are artificially large and might be misleading, therefore only percentages and appropriate statistics (means and standard errors of means), where applicable, are reported in the tables.

Tables 1 through 8 present the data of need items. Table titles coincide with the headings used in the questionnaire (Appendix C). Each table contains weighted percent distribution, estimators of means and standard errors of means. The composites constructed out of these next items will be discussed in the following section of hypothesis testing.

Table 9 shows the data on importance of goals students might have wished to achieve and their assessement of likelihood in achieving those goals when they were leaving their countries for the U.S. Overall, primary academic goals scored high, the highest being the goal of "obtaining the degree." Lowest importance was the goal of learning about the U.S. Students were quite optimissic about achieving their primarily academic goals, particularly obtaining the degree. However, we also note the lowest mean score was for the likelihood to "get to know U.S. professionals in your field." These items were divided into two importance composites and two satisfaction composites. We consider the importance placed on goals reflecting needs of students

when they were leaving for this country, and the perceived likelihood of achieving them as being a reflection of their satisfaction of the progress toward achieving them. Therefore, the composite of importance of goals and perceived likelihood of schieving them will be presented along with the need composites in the section on hypotheses testing.

Among all the needed items presented in Tables 1-9, the ten most important items (listed from the highest) were:

- 1. Need for having enough money for basic living expenses.
- 2. Goal of obtaining the degree.
- 3. Goal of obtaining specialized skills and knowledge in your field.
- Need for enough money for school.
- 5. Need for enough money for necessary medical care.
- Anticipated need for finding a job appropriate to your training upon returning to the home country.
- 7. Goal of gaining practical experience in your field.
- 8. Need for work experience in your field before returning home.
- 9. Need for training to apply knowledge.

 Anticipated need for receiving the latest professional materials in the field.

The least important items (listed from the lowest) were:

- 1. Need for having another student to help you with your study.
- 2. Need for information about dating behavior with U.S. nationals of the opposite sex.
- Need for getting accustomed to U.S. food.
- 4. Need for observing your religious practices.
- 5. Need for borrowing necessary furniture.
- 6. Need for recreational activities available off campus.

- 7. Need for sharing housing with U.S. nationals.
- 8. Need for imformation about English courses for foreign students.
- 9. Need for information about available food and spices you are accustomed to using.
- 10. Need for learning how universities provide assistance to local communities.

With regard to satisfaction of needs, the ten most satisfied need items were:

1. Goal of obtaining the degree.

- 2. Goal of obtaining a broad education.
- Goal of obtaining specialized skills and knowledge in your field.
- 4. Need for information about the registration procedure.
- 5. Goal of broadening your view of the world.
- 6. Need for information about the efficient use of the library.
- 7. Need for obtaining basic knowledge in your area of study.
- 8. Need for information about clothes needed.
- 9. Need for understanding course requirements and instructions.
- 10. Need for imformation about the procedure to begin your degree program.

The ten least satisfied (listed from the least satisfied) items were:

- Need for getting a work permit for off-campus jobs.
- 2. Need for finding a part-time job at the university related to your degree program.
- 3. Need for exchange of visiting professors between universities of your country and those in the U.S.
- 4. Need for economic contributions of foreign governments to U.S.
- 5. Need for having magazines and newspapers from your country available in the university library.

- 6. Need for work experience in your field before returning home.
- 7. Need for having publications in your area of study from your country available in the university library.
- 8. Need for finding a job for your husband or wife.
- 9. Need for seminars with students from several departments to deal with problems of national development.
- Need for having U.S. nationals correctly informed about your country.

Table 10 presents the data (percent distribution, means and standard errors) with regard to English language skills. The importance of various English language skills as self-evaluated, and the evaluation of English courses among those who had taken English courses are included. These items were developed into three composites: the importance composite (measure of linguistic needs), the evaluation composite (subjective measure of proficiency), and the course evaluation composite for English remedial courses. They will be discussed in the section on hypothesis testing.

Students placed high importance on all the skills we delineated. The highest mean score was shared among understanding spoken English, reading textbooks and journals, and writing papers and a thesis. Respondents rated the skill to converse with faculty members and other students to be least important, even though still rated highly. They tended to consider interactional linguistic skills to be less important.

They evaluated their own skill of reading being the highest and the skill of participating in class discussion being the lowest. Among those who took English courses, they considered that those courses were most helpful to improve reading skill and least helpful to improve the skill of taking class notes. That is, they considered English remedial courses contributed

most to improve the very skill which they needed to improve least according to their self evaluation.

Table 11 presents other data regarding English courses. About one half of the students had taken English courses for foreign students. Among those who had not taken such courses, the most frequent reason given was "I was not required to take any of them," followed by, "I do not feel I need to improve mey English." An estimated 27% of the population never took the TOEFL examination. Among those who had taken it, one fourth reported scores in the range of 501-550, while nearly one third reported scores over 550.

Table 12 presents data on factors students thought prevented them from establishing good relationships with U.S. nationals. Over all, they did not perceive any one of the listed factors as serious barriers. "Your being a foreigner" received the highest mean score, but it was considered as only "somewhat" preventing them from establishing good relationships, closely followed by "Their attitude toward you." The least important barrier was one's religious background.

In Table 13, data with regard to rating of oneself and prestige accorded to one's country are presented. Students were asked to give ratings on three characteristics of oneself and their home country's prestige, as they themselves perceived, as they thought their friends in home countries would rate, and as they perceived U.S. students would rate. For every item, the mean rating score was highest for their perception of rating by friends in the home country, followed by their own rating, and last by their perception of how U.S. students would rate. Among the four items, (a. is academic performance, intelligence, physical appearance, and prestige of home country), the

prestige of home country received the lowest average score in all three "views," while intelligence and academic performance were rated higher than physical apprearance and home prestige.

Table 14-16 present personal characteristics of students. In Table 14, which includes basic demographic data, the majority of students fell in the age range of 23-32, an estimated three fourths of the population were male, the majority of students were single, and nearly 40 percent of students were married and accompanied by their spouses. As to the primary financial sources, an estimated one third of the population were supported by private sources such as parents or relatives. The second and third large categories were those on university assistantships and those on home government scholarships. The table also includes information as to major areas of study, grade point average and academic levels.

Table 15 presents percent distribution of countries of origin and regions of the world. The largest groups came from Iran, Taiwan, Nigeria, and India. In Table 16, with data on living arrangements, we see nearly one half of this population lived in apartments off campus. Table 17 presents information as to returning home. Two questions were asked, tapping on the students' return intention. Due to the difference in missing cases, the percentages of no intention to remain in the U.S. differ between the two questions. An estimated one fourth of this population had no intention of staying in the U.S. permanently under any circumstances, while approximately one fourth had jobs waiting in home countries. On the other hand, one third had not made any plans about finding jobs.

- b. These figures do not total to 100, since respondents were able to choose more than one reason.

4. Hypothesis Testing

大学の大学の大学の大学の大学の大学の大学の大学の一

In this section, highlights of the results of hypothsis testing are presented. Each one of the thirty-one hypotheses delineated in the chapter on Theoretical Framework was reduced to empirical hypotheses. As far as hypothesis testing was concerned, importance of needs was operationally measured by 24 importance composites, and satisfaction of needs by 24 satisfaction composites. This replaces individual items which were judged to be too numerous to deal with in this report. Linguistic needs as measured by composites for English language skills will be presented after the results on these need composites are presented. Therefore, in the following tables, English language composites are not included.

Table 18 presents composite codes, their names, and items used to form the composites. Item numbers correspond to the numbers in the questionnaire (Appendix C). Each composite score was the sum of scores of items. Tables are presented only for those hypotheses where independent variables are categorical measures. Otherwise, weighted Pearson's correlation coefficients are given.

Hypothesis 1: Perceived importance of needs is greater than satisfaction of them.

For all need composites, importance scores were found to be significantly higher than satisfaction scores beyond .01 level. Thus, the hypothesis was supported.² The data on the difference between importance and satisfaction scores are found in Table 19.

When the individual need items were examined, only three items had significantly higher satisfaction scores than importance scores, which implied that students were satisfied with these needs more than to the extent they regarded them important. The items were "need to know about clothes needed," "need for getting accustomed to U.S. food," and "need for observing one's religious practices."

Hypothesis 2: importance of educational needs does not differ from importance of other needs.

Hypothesis 3: Satisfaction of educational needs does not differ from satisfaction of other needs.

Table 19 presents detailed data for these hypotheses.

Among twenty-three composites twelve of them are primarily educational, while eleven are not. Composites were divided into two categories according to their mean scores: the high importance category for the top 12 composites and the low importance category for the remaining 11 composites. For both importance and satisfaction composites, the distribution was same. Six of the primarily educational composites fell in the high importance and high satisfaction categories, and likewise, six of primarily non-educational composites fell in the same category. The remaining six educational composites and the remaining five non-educational composites fell in the low importance and low satisfaction categories. The distribution was nearly identical between educational and non-educational composites. Furthermore, noneducational composites in this study are highly associated with educational needs by content due to the very nature of the study. We conclude, as far as the particular types of needs included in this study, that we did not find any significant difference either in terms of importance or in terms of satisfaction between primarily educational and nor educational needs. Educational vs. non-educational dichotomy itself is questionable, when applied to students.

Hypothesis 4: Importance of needs varies by sponsorship categories of students.

Mypomesis 5: Satisfaction of needs varies by sponsorship categories of students.

a. All the figures are weighted population estimates.

. For names and items included in each composite, see Table 18.

Ail the means were found to be significantly different from zero beyond .01 level. Means and SE are those of differences between importance and satisfaction composite scores of individual observations, weighted. . ن

For most of the composites, sponsorship categories did not differ significantly. Significant differences were noted, however, in seven importance composites and in six satisfaction composites. (See Table 22). Importance composites scores analyzed by sponsorship categories are presented in Table 20, and the data satisfaction composites in Table 21. The results of empirical hypotheses tested are shown in Table 22.

First, the rank order of the categorical means for each composite is presented from high to low reading from left to right. For the remaining hypotheses, the order will not be presented, since the rank order can be easily noted by inspection of tables. Furthermore, significant rank orders are designated under the column of "significantly different categories" in the tables.

A special guide to read the notations under "significantly different categories" is given at this point. Detailed findings of empirical hypotheses tested can be read by following this instruction, which will be applicable to all the tables in this appendix where the heading, "significantly different categories," appears. None means that norm categories were found to be significantly differ om others in terms of composite means. Where category numbers are written, the category (or categories) with a higher mean is placed on the left side and the one with a lower mean on the right side of "vs." A comma between two category numbers means that the adjacent categories did not differ significantly between themselves, but differed from the category on the other side of "vs.". For example, with regard to importance composite Cl in Table 22, category 2 placed significantly higher importance than category 4 on composite Cl. It also shows that category 2, however, was not significantly different from categories 1 and 3, likewise category 4 was not different from categories 1 and 3. Another example: In

a. For the composite names and items included, see Table 18.

Categories are: 1 * AID-sponsored, 2 * home government sponsored, 3 * other scholarships and assistantships, 4* self or private sources. The categories are ranked from high to low reading from left to right. ф.

T test (pp. 116-117, Ott. 1977) was used for all the group mean comparisons. The categories designated differed in their means beyond the .01 level of significance. None indicates no significant differences among the categories. For the guide to read this colurn, see page 31. ť

the same table, as to C5, category 1 was found to place significantly higher importance on this composite than categories 4 and 3. Even though category 4 had a higher mean than category 3, they were not significantly different from each other. Category 2 was found to be not significantly different from any one of the others.

Even though not all composites showed significant differences among the sponsorship groups, we note some tendency which deserves a mention. Overall, category 3 (predominantly assistantship supported) placed less importance on composites 3 through 21, which are mostly current academic needs. We also noted, even though not all are statistically significant, that this category tended to rank high for the same composites of needs in terms of satisfaction scores. In other words, this category of students appeared to experience least frustration. They were less concerned with these academic needs, while they tended to be more statisfied with the same needs than students in other categories. We attribute this tendency to the experiences on U.S. campuses for those who receive assistantships as being substantively different from those who are not on assistantships. We realize this claim warrants further investigations.

Another striking tendency to be noted on Table 22 is the clustering of category 1 at the lowest rank for importance composites C23 through C47, (except C39 and C45), even though statistically not significant. These are needs related to mostly non-academic issues and post-return conditions. It appears that this category of students (AiD sponsored) were less concerned with non-academic needs and needs in terms of future. Once again, we repeat these rank orders, were statistically not significant and should

be taken as trends which need to be further investigated.

Hypothesis 6: Importance of needs varies by age of students.

Hypothesis 7: Satisfaction of needs varies by age of students.

Most of the correlation coefficients between need composites and age were statistically significant. However, none were .2236 or higher, which means age accounted for 5% or more of variance in none of the composites. The three highest coefficients were .17 for C8, .16 for C33, and .14 for C12.

Hypothesis 8: Importance of needs varies by sex of students.

Hypothesis 9: Satisfaction of needs varies by sex of students.

Table 23 presents the results of testing the empirical hypotheses for the above and composite data.

For most of the composites, sex categories showed no significant differences. Only four composites showed significant differences between males and females. In all four composites, female students had significantly higher composite scores than male students. (For the guide to read the data under "significantly different categories," see page 33.)

<u>Hypothesis 10</u>: Importance of needs varies by marital status of students. <u>Hypothesis 11</u>: Satisfaction of needs varies by marital status of students.

We considered the presence or absence of a spouse would be more relevant to this group than the presence or absence of a family, knowing that

Even though Fisher's tests can deal with unequal size group comparisons (Ott, pp. 116-117, 1977), a better comparison of AID students would be not with the rest of the entire sample but with those who are at schools in Stratum I where most of the AID students are found. For Phase III, such comparisons will be recommended.

a, b See Footnotes a and b in Table 21.

c. See Footnote d in Table 22.

one half of the pretest sample was single. We analyzed the need composites by three categories of marital status; (1) single, (2) married, the spouse with the student, and (3) married, the spouse at home. There were a small number of students in the fourth category (divorced, separated, or widowed). We did not include this category due to its extremely small size. The results of the tests and data are found in Table 24 for Hypothesis 10 and in Table 25 for Hypothesis 11. Two importance composites were found to be significantly different among the categories, while four satisfaction composites indicated differences.

Hypothesis 12: Importance of needs varies by the command of English students have.

Hypothesis 13: Satisfaction of needs varies by the command of English students have.

The command of English was operationally measured by the TOEFL score ranges. Subjective evaluation (self-evaluation, C50) was also used to determine the association between other need composites and this measure. Even though most of the correlation coefficients between TOEFL ranges and need composites were statistically significant far beyond the .01 level, TOEFL score ranges did not account for 5% or more of variation in any of the composite scores. The three highest coefficients were with C21 (r = .14), C22 (r = .12), and C33 (r = .15).

The subjective measure of the command of English (C50) showed several highly significant and substantive correlations. Those which accounted for more than 10% of variation in the need composite score were correlation with C22 (r = .43) and C48 (r = .44). Those accounting for less than 10%

but more than 5% were with C2 (r = .31), C4 (r = .28), C10 (r = .23), C26 (r = .29), C28 (r = .31), C36 (r = .29), C46 (r = .46), and C52 (r = -.24).

Hypothesis 14: Importance of needs varies by graduate vs. undergraduate status of students.

Hypothesis 15: Satisfaction of needs varies by graduate vs. undergraduate status of students.

Undergraduate and graduate students did not differ with regard to most of the need composites. However, with regard to importance composites, the differences were noted in the following: graduate students scored higher in one composite, while undergraduate students scored higher in six composites. As to satisfaction composites, graduate students scored higher than undergraduate students in four composites, while undergraduate students did not exceed graduate students significantly in any one of the satisfaction composites of needs.

Table 26 presents the results of testing empirical hypotheses for the above and data for the need composites.

Hypothesis 16: Importance of needs varies by major field of study.

Hypothesis 17: Satisfaction of needs varies by major field of study.

Major fields of study were grouped into the following five categories for testing purposes: (1) engineering, (2) agriculture, (3) natural and life sciences, and (5) other. (For this report, we considered it would not be feasible to analyze the data in more detailed major categories.)

See Footnote a, Table 21 See Footnote b, Table 24 . .

C. Classification categories: 1=Undergraduate, 2=Graduate
 d. See Footnote d, Table 24

See Footnote d, Table 24

As to importance, there were significant differences among categories with regard to ten importance composites, while no significant differences were found among thirteen importance composites. As to satisfaction, the hypothesis was supported by only three composites. The results of the tests and data are presented in Table 27 for Hypothesis 16, and in Table 28 for Hypothesis 17.

Hypothesis 18: Importance of needs varies by length of stay in the U.S. and at the school.

Hypothesis 19: Satisfaction of needs varies by length of stay in the U.S. and at the school.

Length of stay in the U.S. and at the school was measured by (1) the total months of stay in the U.S. and (2) the total months of stay at the university of current enrollment. Both measures correlated significantly with most of the composites. However, none explained 5% or more of variation in any composite. Among the correlation coefficients between the total months of stay in the U.S. and the composites, the highest three were with C28 (r = .17), C4 (r = .16), and C33 (r = .15). Among the correlation coefficients between the total months of stay at the university and composite measures, the highest three were with C2, C6, and C26 (all r = .14).

Hypothesis 20: Importance of needs varies by the region of the world from which students come.

Hypothesis 21: Satisfaction of needs varies by the region of the world from which students come.

The regions included were Africa, South and East Asia, Southwest Asia, and Latin America. Europe was excluded from thi analysis, since only two

The second secon

Table 28. Satisfaction of Needs: Composite Means and Standard Errors by Major, Recoded^{a.}

40

See Footnote b, Table 24 Ę,

Recoded Major Categories: 1=Engineering, 2=Agriculture, 3-Matural Life Sciences, 4=Social Services, 5=Others. نۍ ن

See Footnote d, Table 24

countries, Portugal and Turkey, were included in this study and students from these two countries were comparatively very small in number. As to importance of needs, twelve composite scores were significantly different among the regions. As to satisfaction of needs, only three composites showed no significant differences among the regions. The results of the tests and data are presented in Table 29 for Hypothesis 20 and in Table 30 for Hypothesis 21.

Hypothesis 22: Importance of needs varies by whether or not students participated in an orientation program.

Hypothesis 23: Satisfaction of needs varies by whether or not students participated in an orientation program.

Participation in an orientation program was operationalized by using the following four categories: (1) did not attend at all, (2) attended only in the U.S., (3) attended only in home country, and (4) attended orientations both in home country and in the U.S. Hypothesis 22 was supported with regard to only three need composites, and Hypothesis 23 with regard to four composites. The results of the tests and data are presented in Table 31 for Hypothesis 22 and in Table 32 for Hypothesis 23.

Hypothesis 24: Importance of needs varies by the amount of previous international experience students had.

Hypothesis 25: Satisfaction of needs varies by the amount of previous international experience students had.

Operational measures for previous international experience were (1) the total number of foreign countries visited besides the U.S., and (2) the total number of months spent in those countries. Most of the correlation coefficients between each of the above two measures of previous

Orientation categories: 1 = did not attend any orientation at all, 2 = did not attend in their country but did not attend attend in the U.S., 3 = did attend orientation both in their country and in the U.S. . ن مُ

d, See Footnote d, Table 24

international experience and need composites were statistically significant. However, neither one of the measures explained 5% or more of variation in any need composite. The highest three correlation coefficients of the total number of foreign countries visited were with C 26(r = .11), C28 (r = .10), and C31 (r = .11).

The correlation coefficients of the total number of months spent in those countries were overall very low, even though significant. The only coefficient exceeding the absolute value of .10 was with C5 (r = -.10).

Hypothesis 26: Importance of needs varies by whether or not students have jobs waiting for them in home countries.

Hypothesis 27: Satisfaction of needs varies by whether or not students have jobs waiting for them in home countries.

Students' job prospects were measured by asking a question, "Are you trying to find a job in your country now?" The responses were recorded in four categories: (1) trying to find a job, (2) planning to find a job, (3) no plans made for finding a job, and (4) a job waiting at home. We decided to compare all the four categories, even though we expected the difference to be found between the fourth category and the rest according to the hypotheses. The importance scores of seven need composites indicated statistically significant differences among job categories as defined above. As to satisfaction, ten need composites were found significantly different among job categories. With regard to those composites, the students with jobs waiting at home were the most satisfied group. The results and data are found in Table 33 for Hypothesis 26 and in Table 34 for Hypothesis 27.

b. See Footnote b, Table 24

Finding future job categories: 1=Yes, 1 am. 2=No, 1 am not, but 1 plan to do so. 3=No, 1 am not, 1 have not made any plans about finding a job waiting for me. ن

d. See Footnote d. Table 24

Hypothesis 28: Importance of needs varies by school size where students are enrolled.

Hypothesis 29: Satisfaction of needs varies by school size where students are enrolled.

Schools of students' current enrollment were measured by six ranges with 10,000 intervals. Correlation coefficients between school size and need composites were mostly statistically significant. However, none accounted for 5% or more of variation in any composite. The three highest correlation coefficients were found with C4 (r = .15), C6 (r = .13), and C20 (r = .15), all positive with satisfaction scores.

Hypothesis 30: Importance of needs varies by living arrangements of students.

Hypothesis 31: Satisfaction of needs varies by living arrangements of students.

Living arrangements of students were measured in two ways: (1) residence and (2) with whom they lived. The first measure was divided into three categories: (a) in a dormitory, (b) in married student housing, and (c) other (off campus). The second measure was broken down into five categories: (a) with U.S. students, (b) with students from other foreign countries, (c) with students from one's own country, (d) with one's spouse, and (e) alone. With regard to residence categories, differences were found in four importance scores of need composites and three satisfaction scores. (See Table 35 for Hypothesis 30 and Table 36 for Hypothesis 31.)

In terms of the second measure of living arrangements, two importance scores were found to be significantly different among the categories. Ten satisfaction scores were significantly different, two of which were also found significantly different in the first measure's categories. (See Table 37 for Hypothesis 30 and Table 38 for Hypothesis 31.)

a, b, and d. See Footnotes a, b, and d in Table 24.

c. Categories: 1=U.S. students, 2=Foreign students from another country, 3=students from your country, 4=Your spouse (and children), 5=Alone. We did not include the category, U.S. family, for the comparisons due to the extremely small size.

e. Applicable only to Category 4.

Hypothesis 32: Importance of needs varies by prestige accorded to one's country.

Hypothesis 33: Satisfaction of needs varies by prestige accorded to one's country.

Prestige accorded was measured by asking the students how they thought U.S. students would rate their home countries in terms of prestige in the world. Most of the correlation coefficients were statistically significant. None accounted for 5% or more of the variation in any need composite. The three highest correlation coefficients were with C42 (r = .20), C44 (r = .21), and C48 (r = .19), all satisfaction composites. This measure of prestige of one's country accounted for a substantial amount of variation in none of the importance scores.

Linguistic Needs

Selected hypotheses were also tested with measures of linguistic needs, i.e. composites of English language skills. Linguistic needs were measured by two composites: (1) importance of English language skills and (2) self evaluation of English language skills one has. In addition, we included a composite to measure evaluation of English remedial courses.

With regard to sex categories, graduate vs. undergraduate status, regions of the world, fields of study, and living arrangements, five significant differences were found among the three English language composites.

The results of the tests and data are presented in Tables 39-42.

Importance and Self Evaluation of English Language Skills and Evaluations of Remedial English Course to Improve the Skills: Composite Means and Standard Errors by Sponsorship Categories Table 39 .

a, c-f. See Footnotes on Table 39.

o. Categories: 1=Dormitory, 2=Married Student Housing, 3=Other (Off-Campus)

Categories: |=U.S. students, 2mForeign students from other countries, 3mStudents from one's own country, 4mYour spouse (and children), 5mAlone. We did not include the category, U.S. family, for this comparison due to its relatively small size. 6

With regard to age, length of stay in the U.S. and at the school, and school size, most of the correlation coefficients were significant except the one between school size and evaluation score of the remedial courses. However, none of these independent variables accounted for 5% or more of the English language composites. The only correlation coefficients worthy of mentioning were the one between the total months of stay in the U.S. and self evaluation of English skills (r = .17) and the one between the total months of stay at the school and self evaluation of the skills (r = .13).

5. Cross-Tabulations of Personal Characteristics.

In this section. We present cross-tabulations of selected personal characteristics with (1) sponsorship categories, (2) regions of the world, (3) fields of study, and (4) sex categories of students. The figures in this table are population estimates with use of weights; therefore, only percent ges are presented. (Weighted frequiries might be misleading.)

Brief comments on the tables are given below.

Tables 43 through 59 present crosstables of selected characteristics by sponsorship categories. On TOEFL, for example, sponsored students scored over 550, whereas among the other scholarship and assistantship students, 51% scored over 550. Fairly high proportions of students supported by AID, home governments, and self or private sources did not take TOEFL examinations (23.6%, 27.5% and 32.7% respectively), while 15% of students on other scholarships and assistantships did not. (See Table 43.)

Table 44 gi... "s the comparison of sponsorship categories and living arrangements. For AID students, a majority of them were either living alone (25.6%) or with their spouse (25.3%), while the other three categories of students lived more with their spouses than alone. More AID students resided with U.S. families and students from other countries than did the

c. A mixture of friends and relatives.

other three sponsorship categories of students. Yet, for all four categories, the top three living arrangements were (1) with spouse, (2) alone, and (3) with student(s) from one's own country.

Table 45 presents another measure of living arrangements tabulated by sponsorship categories. For all the categories, the highest proportion lived in apartments. For grade point average (Table 46), all four categories had the majority of students in the highest range, 3.25 - 4.00 average, students on scholarships and assistantships reporting the largest number (89.5%) in this category. As to sex categories of students (Table 47), for all four categories, students were predominantly males. Proportionally more male students were found among AID and home government sponsored categories than the other two sponsors.

Table 48 shows a striking difference among sponsorship categories.

Over 50% of students sponsored by either AiD or home government had a job waiting for them in their home countries, while less than one-fifth of scholarships and assistantships students and only 11% of private self-supported students had a job waiting for them. On the other hand, about 45% of self or privately supported students had neither a job waiting nor a plan to look for one in their home countries. These responses were least frequent among home government supported students (10.3%).

Table 49 illustrates the relationship between sponsorship and participation in orientation programs. AID sponsored students showed the highest attendance both in home countries and in the U.S. However, we noted even this category of students had 29% of them not attending any predeparture orientation programs in their home countries. The least attendance of orientation programs was noted among self or privately supported students both in home countries and in the U.S.

Did Not Attend	6.7	18.3	19.5	23.4

Percentages are population estimates computed with use of weights. Therefore, frequencies are not presented in the table. Percentages do not total to 100.0%, since respondents were allowed to mark more than one orientation.

b. Primary sources of support.

Table 50 and 51 present data on return intention of students by sponsor-ship categories. Again, a striking difference is noted among sponsorship categories in this area. About one half of both AID sponsored and home government sponsored students responded they would definitely not remain in the U.S., while the proportion for the other two categories dropped drastically to near one-fifth. For the hypothetical question as to the possible reasons for remaining in the U.S. permanently (Table 51), the most frequently mentioned reason was political conflict at home among AID, home government, and self or privately supported students, while it was a good job offer in the U.S. among scholarship and assistantship students.

Table 52 presents sponsorship categories by fields of study. The students appear to be well distributed with 28.2% being the highest concentration in one area (engineering scholarship and assistantship students). AlD and home government sponsored students showed higher concentration in agriculture in contrast to the other two categories of students. For all four categories, engineering encompassed the most students, except among self or privately supported students, business and management had an equal concentration of students.

In comparing regions of origin with sponsorship categories (Table 53), we notice that nearly 70% of the scholarship and assistantship students were from South and East Asia. For AID sponsored, about 80% came from Africa and South and East Asia while for home government sponsored, 65% came from Africa and Latin America. Self or privately supported figures show that a large majority came from all parts of Asia (70%). Marital status and classification was also compared with sponsorship categories (Tables 54 and 55). The majority of students tend to be single among those supported by AID, scholarships and assistantships, and self or private

b. Primary sources of support.

sources. The government category was the only exception with the majority of students indicating that they were married (54.1%).

Among those who were married, AID students were more likely to leave spouses at home, while the other students were much more likely to have their spouses with them. As to classification, for all the categories except scholarships and assistantships, master's students were most numerous. Among AID sponsored students, they amounted to more than half of this category. On the other hand, the category of scholarships and assistantships was, by virtue of its category definition, predominantly Ph.D. students, since assistantships tend to be awarded to Ph.D. candidates, particularly so among foreign ctudents.

Table 56 presents cross-tabulation of secondary sources of support by primary sources of support.

In addition to cross-tabulations, we conducted comparisons of sponsorship categories with regard to their views of barriers in establishing good relationships with U.S. nationals (Table 57), their perception of self and prestige of their home country (Table 58), and some demographic characteristics (Table 59). These tables can be read in the same manner as the tables presented in Section C of this appendix. Briefly, as to their perceptions of barriers, the four sponsorship categories were mostly similar except in two factors: political view and the foreign student's attitude toward others. AID sponsored students did not differ from other categories in their perception of any one of the listed barriers. As to one's academic performance and intelligence as rated by oneself, perceived rating by friends in one's home country, and perceived rating by U.S. students, students on scholarships and assistantships consistently indicated higher ratings than other categories of students. We attribute this significant

c. The group means differ beyond .01 level of significance.

by virtue of being assistants. Overall, they indicated they had much better images of themselves with regard to academic performances and intelligence. On the other hand, the four categories were not significantly different regarding their rating of physical appearances. As to the rating of prestige of one's country, AID sponsored students showed significantly lower ratings than other categories in terms of their perception of rating by friends at home and rating by U.S. students. We are not in the position to speculate the reason for these differences at this point.

Table 59 also presents some significant differences among sponsorship categories.

Tables 60 and 61 present cross-tabulations of marital status and fields of study by regions of origin. For Africa and Latin America, there was an approximately equal distribution of married and single students. However, for South and East Asia, Southwest Asia, and Europe, more students tended to be single rather than married. For Africa, 11% of the students had spouses still in their home country while less than 5% of all the other regions indicated this situation. Fairly even distribution of fields of study was noted by regions except for Southwest Asia where 35.5% of these students are in engineering.

Tables 62 through 65 present cross-tabulations of selected characteristics of fields of study. In Table 62 some variation in return intention exists by fields of study. Students in education indicated the highest intention of not remaining in the U.S. permanently (52.9%), while those in business and management had the lowest percentage (16.9%). As to the possible reasons for remaining in the U.S., for every field listed, the top two reasons were political conflict at home and a good job offer in

the U.S., except for students in humanities where marriage to a U.S. citizen was the most mentioned reason. For all the fields listed, except engineering and business and management, one-third to one-half of the students indicated nothing would make them stay permanently in the U.S. As to TOEFL score ranges (Table 64), most fields showed similar distributions, concentrating in the top three categories, i.e., scores over 500. Humanities had a rather different distribution including its 44% for not taking the exam at all. Table 65 presents job situations. Agriculture had the highest proportion of students (over one half) with jobs waiting for them, followed by education (42.9%). On the other hand, engineering had the highest proportion of students, nearly 40%, who had no plans to look for jobs in hume countries, followed by those in health professions (38%).

management, health professions and others, the majority of students were single (Table 66), whereas in education, humanities, and social sciences, the majority of students were majority of students were married.

Tables 67 through 69 present a number of personal characteristics cross-tabulated by sex categories. The highest percentages of males were in engineering (29.9%) while the highest percentage of females was found in others (Table 67). The highest percentage of both males and females was at the master's level (31.4% and 36.3% respectively). However, 30.3% of the males were at the Ph.D. level, with only 19.0% of females at this level (Table 67).

As to the regions of the world, a large share of female students was from South and East Asia (45.7%), while 35.4% of males came from the same region (Table 68). The majority of students, both female and male,

APPENDIX B: OTHER RESPONSES

Following each category of need items on the questionnaire, an item called other needs was inserted. Many respondents availed themselves of the opportunity to articulate additional needs and concerns not fully tapped by the questionnaire. Out of 1856 respondents, only a small fraction of them wrote in other responses. However, we found some of their responses rather revealing and thought provoking. A summary of the responses to each category follows.

The material presented in this appendix was organized by Barbara Munson, one of our data assistants, who also acted as our editor based on her training and experience in English language instruction. The authors wish to acknowledge Mrs. Munson for her special contribution to this section.

Information (75 responses):

The foreign students wanted to know about availability of transportation (within the community and to airports), safety of cities, regulations on driving, racial attitudes and prevalence of discrimination among U.S. nationals, and opportunities for jobs. Expense evidently entered into many of their concerns, because information as to costs of travel and availability of an emergency cash/loan fund were mentioned.

More detailed information about universities was desired. Respondents felt it would be advantageous to know in advance about universities and their specialities, plus more details on the entire college system (exams, credits, majors). A need for further English courses was mentioned as the courses currently offered are too rudimentary, e.g. intermediate English courses for graduate students would be helpful.

Degree program (45 responses):

.

Additional responses within the degree program fell into two categories—money and applicability of the program. Foreign students seemed to feel that they are overcharged by universities (because they pay 3-4 times the in-state tuition) and that more and higher-paying assistantships should be available.

Course requirements need to be more flexible, because courses like American history and political science are not of much use to a foreign student. Most research was seen as geared to the department's research program, not to the students' needs. Foreign students also felt that information about research going on in the home country was of great importance.

Relevancy of the degree program (20 responses):

Comments in this area were best summarized by this student: "Classroom learning is very ok, but practical experience is not there. Even co-op, though allowed is not in practice." Apparently practical experience

for two to three years in the U.S. before returning to the home country is a major unfulfilled need of foreign students. Another concern was continuing communication between the U.S. universities and the student's home country after the student's return. Even though we included items tapping these issues, some students still emphasized them by restating in their own words.

Extracurricular professional activities (33 responses):

Again the need for practical work experience before leaving the U.S. was stressed. This could be accomplished through post-doctoral fellowships, internship programs, or even by working during breaks and summer vacations. Such work would be helpful in applying knowledge to the home country and allowing the student to work out "doubts or problems" as his/her study progresses. Immigration regulations were perceived as the big problem in attaining these goals.

Professional activities were also seen as a help in bridging the gap between the theoretical and the practical. As several respondents wrote, there is a big difference in techniques involved and basic technology and its application from the U.S. to developing nations.

Being a university student (31 responses):

Being respected as a human being and being treated without discrimination concerned many respondents in this area. "Academic segregation" apparently does exist and was seen as a major problem. Cultural exchanges were suggested as a possible remedy. Furthermore, some frustration has resulted from contacts with some foreign students' advisors, because of their lack of personnel and/or understanding.

Again more understanding of the entire U.S. university system was desired, as well as more time to adjust to that system and more freedom to change within it.

Money and jobs (44 responses):

Inflation and immigration regulations were seen as the culprits in money and job problems. Immigration restrictions were judged to be unfair and the immigration officials to be unenlightened and arbitrary in wielding power by some respondents.

Inflation has made it necessary to obtain both financial aid and a job.

Many students are married and have a family to support. Both the student and the spouse need to work but are unable to because of visa restrictions or unavailability of jobs. In addition, money sources from the home country have been interrupted at times, causing further money problems for the foreign students. Deferred payment of fees and reduction in non-resident tuitions were suggested as remedies.

A poignant remark came from one respondent: "Question: how to get enough money for air-ticket to visit home just one Christmas holiday during my course of study?" (This came from a young married man whose spouse remained in his home country.)

Local community life (21 responses):

Bias and hypocrisy toward foreign students were reiterated in this area. Respondents spoke of feeling victimized—by segregation, by hostility (caused by current problems in Iran), by fear of crime. The need is to be treated courteously. As one student wrote, "Generally, students and people understand and accept us....Government and institutions are the problem."

Money is also part of the problem. Medicine, medical care, and insurance are available but too expensive. The large deposits required for housing and utilities create hardships.

Housing needs (20 responses):

Availability of housing was seen as a major need. Housing needs to be close to campus to accommodate those without cars and inexpensive enough that students can manage it financially. In addition, discrimination in obtaining housing was a problem, because of racial reasons or having children.

Students felt they were taken advantage of in obtaining housing. Contracts and leases were not explained and were incredibly complicated. Legal assistance (free) could alleviate this problem.

Interpersonal relationships (14 responses):

Relationships with other foreign students were the easiest to attain.

Apparently there a natural camaraderic exists. U. S. friends were slightly less attainable, especially as friends with whom one could become close.

Advisors and professors were judged to be sympathetic and understanding, but sometimes lacking appreciation of foreign student needs.

Before going home (22 responses):

Lots of questions arose about getting oneself and one's goods home by the cheapest means. Information about student rates and charter flights would be helpful, as would an increase in the book allowance to allow more books to go back. A booklet with this information would certainly help those students who are soon to return home.

The conversion problems of electrical appliances were a nuisance. Students would like to be able to buy electrical items with the voltage they need or at least get converters for them.

Anticipated conditions after returning home (18 responses):

Most needs in this category dealt with hopes and plans for the future.

An often-expressed need was to have adequate equipment and personnel to equip

a lab or research area properly. An additional hope was for ongoing communication through the student returning to the U.S. at intervals or U.S. professionals visiting the developing nation. It would also be helpful to know of organizations within the U.S. with which to maintain contact and receive information about progress and research in the field of study.

Goals on coming to the U.S. (28 responses):

Major goals to be achieved in the U.S. ranged from individual to world-wide. Individual goals included attaining emotional and intellectual maturation, learning self-discipline, being receptive to others' ideas regardless of color, race, or religion.

Many respondents held a world view of their U.S. experiences--to help U.S. nationals to understand my country, to use knowledge cross-culturally, to entice Americans to visit my country, to inform the U.S. of foreign politics, culture and prejudice, and to be able to discuss differing ideologies in a meaningful way. In short, foreign students wanted to show the U.S. that the U.S. is not the whole world.

English skills (30 responses):

Many students responded that they already knew English well before coming to the U.S. However, they could increase their skill in following different accents and learning American slang. Even more, skills are needed beyond the usual English as a foreign language courses—the basics of "writing papers, from research to typing, from punctuation to format." The need is for intermediate English courses not just the remedial courses.

English courses for foreign students (66 responses):

Most of the reasons for not taking English courses for foreign students dealt with having prior knowledge of the language. Many students felt they

were sufficiently proficient in English by virtue of having taken English courses before, taking all high school courses in English, or English being the home country's official language. Several respondents thought practice was the best remedy for any problems, that listening and comprehension needed work, but not grammar.

Factors which prevent relationships with U.S. nationals (88 responses):

Although many foreign students indicated that they have good relationships with U.S. students, many more cited factors which prevented good relationships. Lack of time and being too busy with studies were factors which covered all groups, but basically reasons fell into two categories--"them" and "us".

"They" (meaning U.S. students) were prejudiced against foreigners, uninformed about other countries, superior-acting, too individualistic in attitude, unwilling to make the effort, or generally friendly and polite but not willing to get close. The foreign students were unable to form relationships because they tended to stick together, were uninterested, didn't like the U.S. system, did not know American culture, or spoke accented English and didn't know American slang.

Orientation programs (90 responses):

The Washington International Center (Washington, D.C.) has evidently conducted many orientation programs for incoming foreign students. In addition, student clubs, such as Arab Students Club, Chinese Student Club, and Malaysian Student Association, were another source of orientation programs, as were ex-students, family, and friends. Lastly, U.S. embassies in the student's home country were mentioned by several students as the source of their orientation.

Reasons one might stay in the U.S. permanently (78 responses):

Many students responded with aspects which they liked about living in the U.S.--"good education and good country", better future, personal and professional achievement, advanced society, opportunities. Many just "like it" here. Family considerations were also important. If the children or family wanted to stay, if the student's parents came over here, or if death occurred in the family at home, the student would be more likely to stay here. Religion was mentioned as a factor several times. Several students also feared problems in re-adapting to their home environment and social conditions.

Extra responses (93 responses):

Many of the respondents wrote notes on the questionnaires which provided interesting and lively reading. The most common perhaps was thanking us for our interest and hoping that some help for foreign students would result.

Apparently the questionnaire items tapped into wells of feeling because many students almost literally wrote us books of information on their needs and desires.

As might be expected there were complaints about the research methods employed: the questionnaire was too long, answers were modelled, answers needed more flexibility, some items were unnecessary while other crucial questions were missed.

Suggestions were also made:

- 1) Each foreign student should spend 1-2 hours per day with a U.S. student.
- 2) U.S. students should receive similar questionnaires to determine their attitudes toward foreign students.
- 3) Results of this study should be made available to foreign student advisors.
- 4) Foreign student advisors or representatives should visit the ex-students

in their home country. Dialogue between hosts and guests could be helpful.

5) U.S. government or universities should intervene with the home country on behalf of foreign students, especially to get them more money.

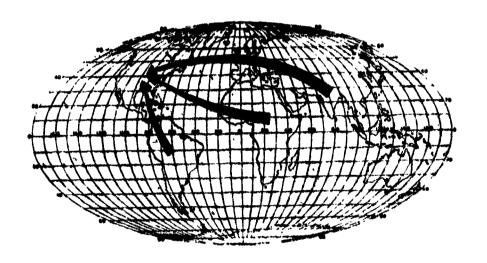

APPENDIX C: QUESTIONNAIRE

The actual size of the questionnaire was reduced to one half by the Printing Office. The questionnaire was printed back-to-back in booklet form.

A Study to Assess the Needs of Foreign Students

What do you need?

Wherever you come from, we are interested in your opinion.

Principal investigator:

M. Y. Lee Assistant Professor Department of Sociology & Anthropology Iowa State University Ames, Iowa 50011

This study is sponsored by the National Association for Foreign Student Affairs (NAFSA).

Confidential
Please do not put your name.

We would like to find out what foreign students need so that U.S. universities and local communities can make necessary adjustments to make the study here more pleasant to foreign students.

You will need about half an hour to complete this questionnaire. Your assistance will be of great value to us. Please complete the questionnaire now and simply put it in a nearby mail box. No postage needed. By helping us, you will be helping students from your country and other countries who are yet to come. Thank you for your participation in this survey.

M. Y. Lee (515)-294-8440
